Power ON / OFF Sequence

The following figures illustrate the recommended power ON and power OFF sequence of SSD1351 (assume V_{CI} and V_{DDIO} are at the same voltage level and internal V_{DD} is used).

Power ON sequence:

1. Power ON V_{CI} , V_{DDIO} .
2. After V_{CI} , V_{DDIO} become stable, set wait time at least 1ms (t_0) for internal V_{DD} become stable. Then set RES# pin LOW (logic low) for at least 2us (t_1)⁽⁴⁾ and then HIGH (logic high).
3. After set RES# pin LOW (logic low), wait for at least 2us (t_2). Then Power ON V_{CC} .⁽¹⁾
4. After V_{CC} become stable, send command AFh for display ON. SEG/COM will be ON after 200ms(t_{AF}).

Power OFF sequence:

1. Send command AEh for display OFF.
2. Power OFF V_{CC} .^{(1), (2)}
3. Wait for t_{OFF} . Power OFF V_{CI} , V_{DDIO} . (where Minimum $t_{OFF}=80ms$ ⁽³⁾, Typical $t_{OFF}=100ms$)

Note:

- (1) Since an ESD protection circuit is connected between V_{CI} , V_{DDIO} and V_{CC} , V_{CC} becomes lower than V_{CI} , V_{DDIO} is ON and V_{CC} is OFF as shown in the dotted line of V_{CC} in above figures.
- (2) V_{CC} should be kept float (disable) when it is OFF.
- (3) V_{CI} , V_{DDIO} should not be Power OFF before V_{CC} Power OFF.
- (4) The register values are reset after t_1 .
- (5) Power pins (V_{DD} , V_{CC}) can never be pulled to ground under any circumstance.

Graphic Display Data RAM Address Map

The GDDRAM is a bit mapped static RAM holding the pattern to be displayed. The RAM size is 128 x 128 x 18bits. For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software. Each pixel has 18-bit data. Each sub-pixels for color A, B and C have 6 bits. The arrangement of data pixel in graphic display data RAM is shown below.
